

The new Superliner® II Transition Sleeper

Now Available!

New for 2018! A brand new HO Passenger car from Kato USA - the Superliner® II Transition Sleeper! An integral part of every Amtrak® train, the unique high-to-low diaphragm arrangement allows for train crew to pass between the taller Superliners and the lower level service cars such as baggage cars.

The new Superliner II Transition Sleeper features real rotating bearing caps, a full interior, and marker lights that can be easily illuminated with an optional lighting circuit. Also coming this year is a restock of various Amtrak cars in modern paint - build the Amtrak train of your dreams in HO Scale!

The Superliner II fleet was introduced in 1990 as Amtrak's next generation of its now ubiquitous Superliners. Visually very similar to their older cousins, the Superliner II's have a host of mechanical and electrical improvements to their design as well as construction.

One of the new styles of car introduced with this new generation of cars was the "Transition Sleeper", or "Transition Dormitory" car. Intended to replace the aging High-Level Step Down cars, the Transition Sleeper fulfills a similar role by having high and low level diaphragms on either end of the car as well as having on-board crew accommodations.
